The mgsa package

Sebastian Bauer, Julien Gagneur

13 October 2010

1 Introduction

Model-based Gene Set Analysis (MGSA, Bauer et al. [1]) is a Bayesian modeling approach for gene set enrichment. The package *mgsa* implements MGSA and tools to use MGSA together with the Gene Ontology [2].

2 Quick start

CAT8

FYV10

We start with a small simulated dataset which contains <code>example_go</code>, a random subset of yeast gene ontology annotations with 20 terms and <code>example_o</code>, a simulated set of observed positive genes. These genes could for example be the "hits" of some screen or a set of differentially expressed genes. In the simulation, the terms GO:0006109 and GO:0030663 were active, implying that genes annotated to these terms were more likely to be observed positives than other genes.

```
> library(mgsa)
> data("example")
> example_go

                                                                        "SEC26"
                                                  "RET3"
[43] "SEC27"
```

The method mgsa fits the MGSA model. It returns a MgsaMcmcResults object whose print method displays the most likely active terms. On this example, mgsa correctly reports largest posterior probabilities for the terms GO:0006109 and GO:0030663. The call to set.seed(), which sets the seed of the random number generator, simply ensures the example of this vignette to be reproducible. It is not required for mgsa() to work.

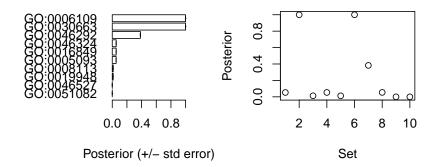

```
> set.seed(0)
> fit = mgsa(example_o, example_go)
> fit
Object of class MgsaMcmcResults
158 unique elements in population.
43 unique elements both in study set and in population.
'data.frame':
                     10 obs. of 4 variables:
 $ inPopulation: int 1 34 2 1 2 8 2 1 21 86

GO:0051082
```

The method plot provides a graphical visualization of the fit.

```
> plot(fit)
```

3 Using the Gene Ontology

The Gene Ontology [2] (GO) provides structured annotations to genes. Genes with the same annotation consitute a gene set. MGSA can be run on these gene sets. GO annotation files for your organism of study can be downloaded at the GO web page: http://www.geneontology.org.

The function readGAF creates an MgsaGoSets object, a particular MgsaSets, from such a gene annotation file. Note that readGAF requires the package GO.db and RSQLite to be installed.

For illustration purposes, a simplified GO annotation file with only three yeast genes is provided:

Object of class MgsaGoSets

```
111 sets over 3 unique items.
```

```
Set annotations:
```

```
term
                                                definition

```

4 Using custom gene sets

4

set2

MGSA is not restricted to Gene Ontology and can be applied to any gene sets. The method mgsa can directly be called on such gene sets provided as list as in the example below.

```
> mgsa(c("A", "B"), list(set1=LETTERS[1:3], set2=LETTERS[2:5]))
Object of class MgsaMcmcResults
5 unique elements in population.
2 unique elements both in study set and in population.
'data.frame':
                     2 obs. of 4 variables:
 $ inPopulation: int 3 4
 $ inStudySet : int 2 1
               : num 0.631 0.154
 $ estimate
 $ std.error
               : num 0.000654 0.000197
Posterior on set activity (decreasing order):
     inPopulation inStudySet estimate
                3
                           2 0.6312916 0.0006535761
set1
```

Internally, the method mgsa indexes all elements of the sets before fitting the model. In case mgsa must be run on several observations with the same gene sets, computations can be speeded up by performing this indexing once for all. This can be achieved by building a MgsaSets.

```
> myset = new( "MgsaSets", sets=list(set1=LETTERS[1:3], set2=LETTERS[2:5]) )
> mgsa(c("A", "B"), myset)

Object of class MgsaMcmcResults
5 unique elements in population.
```

1 0.1542472 0.0001973723

```
2 unique elements both in study set and in population.
'data.frame': 2 obs. of 4 variables:
$ inPopulation: int 3 4
$ inStudySet : int 2 1
$ estimate
            : num 0.63 0.154
$ std.error : num 0.000594 0.000378
NULL
Posterior on set activity (decreasing order):
     inPopulation inStudySet estimate
                                        std.error
set1
               3
                     2 0.6303232 0.0005937597
                          1 0.1542558 0.0003784498
set2
> mgsa(c("B", "C"), myset)
Object of class MgsaMcmcResults
5 unique elements in population.
2 unique elements both in study set and in population.
'data.frame':
                    2 obs. of 4 variables:
$ inPopulation: int 3 4
$ inStudySet : int 2 2
              : num 0.527 0.289
$ estimate
              : num 0.000543 0.000175
$ std.error
NULL
Posterior on set activity (decreasing order):
    inPopulation inStudySet estimate
set1
               3
                          2 0.5272310 0.0005425706
set2
               4
                          2 0.2889352 0.0001751067
```
